Automata Theory is inextricably intertwined with undecidability and incompleteness results. This paper explores the beautiful panorama of undecidability and Gödel-like incompleteness results in automata theory that reveals their ubiquity and clarifies and illustrates how the severity of these results changes with the complexity of the problems and the computing power of the automata.

~~Description: A half-century of automata theory~~

Around the turn of the 19th Century, a Swiss mechanician by the name of Henri Maillardet successfully built a truly remarkable Automaton. Capable of drawing four different pictures and writing three different poems, the "Draughtsman Writer" (left) had a memory which was larger than anything seen before in a device of its kind.
