The standard form of axiomatic set theory is the Zermelo-Fraenkel set theory, together with the axiom of choice. Each of the axioms included in this theory expresses a property of sets that is widely accepted by mathematicians. It is unfortunately true that careless use of set theory can lead to contradictions.

We call this the universal set. It's a set that contains everything. Well, not exactly everything. Everything that is relevant to our question. In Number Theory the universal set is all the integers, as Number Theory is simply the study of integers. But in Calculus (also known as real analysis), the universal set is almost always the real numbers.
