This sequence has a difference of 5 between each number. The values of  $a$  and  $d$  are:  $a = 3$  (the first term)  $d = 5$  (the "common difference") Using the Arithmetic Sequence rule:  $x_n = a + d(n - 1)$   
 $= 3 + 5(n - 1) = 3 + 5n - 5 = 5n - 2$ . So the 9th term is:  $x_9 = 5 \times 9 - 2 = 43$ . Is that right? Check for yourself!

Arithmetic sequences | Sequences and series | Siyavula

Sequences whose rule is the addition of a constant are called arithmetic sequences, similar to geometric sequences that follow a rule of multiplication. Homework problems on arithmetic sequences often ask us to find the  $n$ th term of a sequence using a formula.

Arithmetic sequences are important to understanding arithmetic series.

## Answers to Math Exercises & Math Problems: Sequence

It is an arithmetic sequence. This means that each term has a constant difference/distance relative to its neighbors. Now, the distance between 136 and 3 is 133. This means that the arithmetic step must be a factor of 133 if the step is an integer. 133 is compound with prime factors of 7 and 19.

for the general term of the arithmetic sequence. For example, the sequence. 3, 15, 27, 39, 51, ... has  $a_1 = 3$  and common difference  $d = 12$ , hence a formula for the general term is given by  $a_n = 3 + (n - 1) \cdot 12$  which simplifies:  $a_n = 12n - 9$ .

Arithmetic Sequence: Definition and Basic Examples - ChiliMath

An arithmetic sequence is a sequence where the difference  $d$  between successive terms is constant. The general term of an arithmetic sequence can be written in terms of its first term  $a_1$ , common difference  $d$ , and index  $n$  as follows:  $a_n = a_1 + (n - 1)d$ . An arithmetic series is the sum of the terms of an arithmetic
