Air conditioning. This adds the capacity to cool the ventilated air to below the ambient temperature. It works by cycling refrigerant fluid through a compressor and an evaporator to suck the heat energy from the air entering the cabin. Air conditioning in cars can typically only be set to one temperature across the entire car. The cabin occupants can then set the fan speed and degree of cooling, which in turn determines the temperature inside the vehicle.

Air conditioning refers to manual control of the temperature of the air pumped into the cabin, as well as the speed of the fan. This is what most cars have □ you manually turn on the air conditioner, select the temperature you want, and adjust the fan speed. Depending on your make and model, your passengers might have their own controls to achieve this (dual zone operation). Climate control is different.

Our air conditioning and climate control systems 1 ensure your journey is comfortable - whatever the weather outside. Air conditioning and climate control systems keep a constant, ideal temperature inside your car, ensuring you stay cool and comfortable at all times. The air conditioning system complements the heating and ventilation system in your car. It includes a cooling system, heating, humidity controller and blower unit and works just like the heat pump in a refrigerator.

~~Automotive Air Conditioning and Climate Control Systems ...~~

There has been much debate on the effect of air conditioning on the fuel efficiency of a vehicle. Factors such as wind resistance, aerodynamics and engine power and weight must be considered, to find the true difference between using the air conditioning system and not using it, when estimating the actual fuel mileage. Other factors can affect the engine, and an overall engine heat increase can affect the cooling system of the vehicle.
