'Materials for Architects and Builders' covers the broad range of key materials used within the construction industry and is a descriptive introduction to the manufacture, key physical properties, specification and uses of the major building materials. This new edition has been completely revised and updated to include the latest developments in materials technology, in particular the need to adapt for the ecological impact of different materials. The book is illustrated in colour throughout with many photographs and diagrams showing materials and building components both individually and in use. Each chapter lists the up-to-date British and European Standards, revised Building Regulations together with related Building Research Establishment publications and suggested further reading. • Essential reading for students of building, architecture and construction • Extensive coverage all types of building materials • Updated to include latest national and international standards and regulations

The construction of buildings is learnt through experience and the inheritance of a tradition in forming buildings over several thousand years. Successful construction learns from this experience which becomes embodied in principles of application. Though materials and techniques change, various elements have to perform the same function. 'Principles of Element Design' identifies all the relevant elements and then breaks these elements down into all their basic constituents, making it possible for students to fully understand the given theory and principles behind each part. As all building projects are subject to guidance through the Building Regulations and British Standards, this book gives an immediate reference back to relevant information to help practitioners and contractors identify key documents needed. Yvonne Dean B.A. (Hons) B.A (Open) RIBA, an architect, energy consultant and materials technologist. She also has 15 years experience as a lecturer, travels widely and is a guest lecturer at many universities. She pioneered an access course for Women into Architecture and Building, which has been used as a template by others, and has been instrumental in helping to change the teaching of technology for architects and designers. Peter Rich AA Dipl. (Hons) Architect, started his career with 14 years experience as a qualified architectural technician. He then joined the AA School of Architecture, working with Bill Allen and John Bickerdike after his graduation, later becoming a partner of Bickerdike Allen Rich and Partners. He also taught building construction at the Bartlett School of Architecture, University College London, and architectural design at the Polytechnic of North London. He now acts as a Consultant.

Pressure on space and changes in planning law mean that loft conversions are now at the forefront in the race to improve the performance of Britain's ageing housing stock. Since 1990, roof space conversions have increased UK housing capacity by more than 200 million square feet - a living area equivalent to a medium-sized city - without the loss of a single square foot of greenfield land. Loft Conversions is the definitive technical guide to the conversion of roof spaces in single family dwellings. It brings together a wealth of practical and regulatory guidance in a form that is easy to read and comprehensively illustrated. This fully revised and updated second edition is intended primarily for architects, builders, surveyors and others professionally involved in the process of loft conversion. The insights it provides are also invaluable to self-builders and to householders wishing to achieve a deeper understanding of what a loft conversion involves.

Coming into effect 6 April 2007, when it replaces the 2000 edition (incorporating 2002 amendments) of approved document B (TSO ISBN 011703634X). Approved document B Vol. 2 Buildings other than dwellinghouses is also available (ISBN 0117037257). With addenda (8p., February 2007) which contains two text amendments and an index to the main work

This Health Technical Memorandum takes the form of best practice guidance and recommendations. It provides guidance on the design of fire precautions in new healthcare buildings and major extensions to existing healthcare buildings. It supersedes HTM 81 (ISBN 9780113210824), and HTM 85 (ISBN 9780113217335). This publication provides guidance to achieve a satisfactory standard of fire safety, and recognizes the special requirements of fire precautions in the design of healthcare premises and should allow the current statutory regulations to be applied sensibly within a framework of understanding. The guidance in this HTM satisfies all requirements of Part B - Fire Safety of the Building Regulations 2000 (as amended).

Environmental Health and Housing provides both students and professionals with comprehensive coverage of issues relating to both social and private housing. The book includes basic technical information for completing house surveys, detailed yet clear backgrounds to and explanations of applying relevant legislation, and discussion of current policy and strategy. All this is backed up with case studies and examples of how theory and law are put into practice in real situations. The minefield of overlapping legislation and legal issues are clearly presented as flow charts and tables. Unique in its coverage, clearly illustrated and covering such diverse topics as housing defects, caravan sites, asylum seekers and social exclusion, Environmental Health and Housing is an essential purchase for all students and professionals in the housing sector.

This book forms part of a unique, highly practical and time-saving three volume presentation of the Building Regulations, each book covering all the regulations relating to specific building usage. The chapters of each volume form self-contained units covering all the Regulation requirements applicable to a particular part of a building; thus the reader can ensure that all the Regulations are fully met. Also included is a digest of published standards, guides and technical information as well as reviews of the new Eurocodes currently being introduced. The Building Acts and Regulations Applied: Buildings for Public Assembly and Residential Use covers all the regulations relating to buildings used for public assembly or residential purposes (other than houses and flats), such as theatres, sports stadia, hotels, prisons and halls of residence. It is a useful course companion for BTEC HNC/D and degree courses in building, architecture, surveying, estate management and other built environment disciplines. It is also an ideal reference source for all professionals working in these areas.

This is the third edition of an introduction to building fire safety that explains from first principles the basic strategies of fire

safety design available to the building and construction professional.
