Inlays and onlays ensure conservation of sound tooth structure without undermining the tooth's mechanical and physical properties, while composite offers both the opportunity for correction before cementation and long-term reparability. In separate chapters, the author addresses diagnosis, using radiographs, indications for amalgam, respect for natural dental structures, clinical application of adhesive systems, cavity preparation, buildup and preparation, reconstruction of endodontically ...

Composite Inlays and Onlays: Structural, Periodontal, and ...

The purpose of this book is to set out a simple yet rigorous protocol that can routinely be used to achieve satisfactory results for composite partial restorations. Inlays and onlays allow significant conservation of sound tooth structure without undermining the tooth's mechanical and physical properties. Composite inlays offer two crucial properties: the opportunity for correction before cementation and, above all, long-term reparability. A multidisciplinary approach is of fundamental ...

composites, with no additional preparation for the healthy dental structures. The accurate impression is made using silicone materials. The impression is made in a single-step with dual-viscosity technique, then sent to the laboratory for casting and realization of the composite inlay. The impression of the antagonist was realized

## Indirect Posterior Restoration: Composite Inlays

Composite inlays and onlays can be placed to reduce polymerization shrinkage and composite wear. The advantage of this method is that the main part of the composite is cured outside the oral cavity and only a thin resin layer, the resin cement layer, contributes to shrinkage of the restoration in the oral cavity.

The curing occurs by subjecting the composite to heat, pressure or intense light, and this higher degree of cure improves strength and reduces wear; the indirect composite inlays/onlays are often referred to as 'super cured'. This super curing does, however, leave fewer reactive resin groups to bond to the resin luting cement.

A systematic review and meta-analysis was performed to analyze the survival of onlay restorations in the posterior region, their clinical behavior according to the material used (ceramic reinforced with lithium disilicate, conventional feldspathic ceramic or reinforced with leucite; hybrid materials and composite), possible complications, and the factors influencing restoration success.
