A statement from the British Society of Thoracic Imaging suggests that “ bilateral, subpleural ground glass opacity, ill defined margins, and a slight right lower lobe predilection ” are the most common initial computed tomography findings of covid-19 pneumonia. 4 The statement also suggests that, with disease progression, findings can range from “ focal unilateral abnormality to diffuse bilateral opacities, ” and might evolve to “ consolidation, reticulation, and mixed pattern disease. ” 4

Abstract. The reversed halo sign (RHS) is a chest computed tomography (CT) pattern defined as a focal round area of ground-glass attenuation surrounded by a crescent or ring of consolidation. The RHS was first described as being relatively specific for cryptogenic organizing pneumonia but was later observed in several other infectious and noninfectious diseases.

Computed tomography (CT) scanning, also known as, especially in the older literature and textbooks, computerized axial tomography (CAT) scanning, is a diagnostic imaging procedure that uses x-rays to build cross-sectional images ("slices") of the body. Cross-sections are reconstructed from measurements of attenuation coefficients of x-ray beams in the volume of the object studied.
