Polyphenols are a heterogeneous group of bioactive compounds mainly found in plant-based foods. Numerous clinical and epidemiological studies have led to the result that polyphenol intake may protect against chronic diseases such as cardiovascular and neurodegenerative diseases, cancer, or type 2 diabetes, to name some. Polyphenol intake estimation can be obtained through food frequency questionnaires and nutritional biomarkers, both having their own advantages and disadvantages. Although the association between these bioactive compounds and health seems irrefutable, many questions remain still unanswered. For instance, more studies are needed to identify possible interactions and effect-modulating variables, such as smoking habit, body mass index, sex, alcohol, hormones, other foods, etc. Moreover, intestinal microbiota seems to play an important role in the metabolism of polyphenols, but it is still unclear how.

This book provides guidance on the specification, performance, use and interpretation of the Electric Cone Penetration Test (CPU), and in particular the Cone Penetration Test with pore pressure measurement (CPTU) commonly referred to as the "piezocone test".

In pathology education within North America, there exists a wide gap in the pedagogy between medical school and residency. As a result, the pathology intern often comes into residency unprepared. Completely illustrated in color, this book lays the foundation of practical pathology and provides a scaffold on which to build a knowledge base. It includes basic introductory material and progresses through each organ system. Within each chapter, there is a brief review of salient normal histology, a discussion of typical specimen types, a strategic approach to the specimen, and a discussion of how the multitude of different diagnoses relate to each other.

"Gothic is unique among Germanic languages in regards to the ways it expresses non-agentive actions. It both retains a formal passive and has two periphrastic passives. In addition it presents an intransitive verb class with generally inchoative meaning. R. Moses Katz examines the semantics of these categories and shows how they provide a robust non-agentive paradigm in Gothic, including a functional, result-state perfect in the passive. In two parts, he examines first the inchoative verb and then the periphrastic passive. He proposes that the development of both types is underpinned by a single argument structure based on the resultative, a coordinated event type that links a transition with a resulting state"--

Neuroblastoma is a medical enigma. As a childhood neoplasm arising from neural crest cells, it is characterized by diverse clinical behaviors ranging from spontaneous remission to rapid tumor progression and death. Although clinical outcome can be predicted to a large extent by the stage of disease and the age at diagnosis, an in-depth understanding of its clinico-pathological behavior, now greatly aided by sophisticated molecular genetic profiling, will improve diagnostic precision and refine risk-based therapies. Comprehensive international efforts have advanced our understanding of tumor biology and improved the clinical management of children with neuroblastoma. This book reviews our current understanding of the genes and biological pathways that contribute to neuroblastoma pathogenesis, modern risk-based treatment approaches for these patients, and recent advances in biologically based therapy. It provides a concise up-to-date reference for practitioners, students, and researchers.
