Behavior of protists and fungi, lifeforms which are neither plants nor animals, using specific examples such as algae, mold, and mushrooms.

For the past decade, it has been apparent to both of us that a

During a field trip sponsored by the Forest Pathology Committee of the American Phytopathological Society, on a bus from one site to another, we decided to take the responsibility to prepare a book of this type and began to

plan its composition.

To adequately address the topic of this book as we had envisioned it, we believed that well-illustrated chapters were needed in order to reflect the important advances made by the many investigators who have examined the anatomical and

are attacked by fungi.

Microbial pollution is a key element of indoor air pollution. It is caused by hundreds of species of bacteria and fungi, in particular filamentous fungi (mould), growing indoors when sufficient moisture is available. This document provides a comprehensive

Review of the scientific evidence on health problems associated with building moisture and biological agents. The review concludes that the most important effects are increased prevalences of respiratory symptoms, allergies and asthma as well as perturbation of the

important means for
avoiding adverse
health effects is the
prevention (or
minimization) of
persistent dampness
and microbial growth
on interior surfaces
and in building
structures. [Ed.]
