In March 2011 eleven operating nuclear power plants shut down automatically during the major earthquake in Japan (Fukushima). Three of these subsequently caused an INES Level 7 accident due to the 15 m tsunami causing loss of power leading to loss of cooling and subsequent radioactive releases. Introduction

“ All nuclear plants can be subject to severe accidents due to purely internal causes, but natural disasters like earthquakes, tsunamis, hurricanes, and storm surges make accidents more likely because they cause stresses on the reactor that could lead to some failures while simultaneously disabling one or more safety systems, ” says Ramana, who has worked extensively on nuclear energy.

On 30 October 2020, a significant tsunami triggered by an earthquake of magnitude 7.0 Mw hit the island of Samos (Greece) and the Aegean coast of the Izmir region (Turkey). The event shed light – once again – on the complexity of warning of locally generated tsunamis of rapid onset which challenged the ability of local authorities and communities at risk to take early action.

recent earthquakes and tsunamis in terms of tsunami generation and resulting impacts. The second most important sources of tsunamis are volcanoes and landslides. Tsunamigenic landslides often trigger earthquakes but other mechanisms can also trigger them.

To make matters worse, the tsunami damaged the Fukushima Daiichi nuclear power plant, creating radioactive leaks. The tsunami disabled cooling at three Fukushima reactors, and the cores melted within 72 hours. 8 At first, engineers couldn't stop the leakage, and even after they did, it took months to halt emissions completely. 9 10
