## REACTION RATES MULTIPLE CHOICE QUESTIONS WITH ANSWERS | DocHub

Answer: Rate =  $k[A]^m[B]^n e^{-E_a/RT}$ . Shown in this equation, the factors affecting rate of reaction are: concentration and order of reactants and products ( $k$  , which increases as rate increases), the activation energy ( $E_a$ , which decreases as rate increases), the temperature ( $T$ , which increases as rate increases), and pre- exponential factor ( $A$ , which

More heat energy gives the particles more kinetic energy. More kinetic energy means more movement, so the probability of collisions increases and so does the rate of the reaction. The graph below shows the rate of the same reaction in different temperatures.
