This book addresses the issue of de-spiritualization in education through an interdisciplinary lens. It draws on curriculum scholarship of Dwayne Huebner, Martin Heidegger ' s interpretation of Plato ' s allegory of the cave, Buddhism, theories and philosophies of quantum physics, and philosophical hermeneutics, among others. In doing so, the author identifies the relationship between spiritual truth and education and probes the nature of consciousness, self, and reality. On this basis, she works to explore curriculum as an experience of consciousness transformation vital to the essence and purpose of education and argues for reason with faith and faith with reason as well as the imperative of curriculum imbued with spiritual wisdom and lived experiences.

Covering history, geography, and sociology, these sample lessons and units show how to use the Parallel Curriculum Model to provide rigorous learning opportunities for students in social studies.

A group of science educators with experience of being involved in curriculum development, and in conducting extensive research on many aspects of teaching and learning science, have combined their findings in this volume.; Each author has conducted research into his or her own area of science education and presents the implications of this research for a specific area of science teaching. The experiences of members of the Monash Children's Science Group; specifically three primary teachers and one biology teacher, have also been included so as to present the voices of teachers for whom writing a personal account of their teaching is often an unappealing task.

As a psychotherapist who focuses on working with the issues that challenge midlife and older men, Robert Schwalbe feels that the 60s and beyond can be the most rewarding or the most miserable period in a man's life. An aging male baby boomer looking at 60 encounters very specific psychological and physical changes. The impact of these changes can be felt in relationship to others and in how a man sees himself in his world. Does he continue to fit in? In particular, how a man adapts to being in his 60s is an indicator of how he feels about living the rest of his life. Dr. Schwalbe knows from personal experience, as well as from his patients, the challenges produced by anxiety and depression in dealing with aging in a youth-oriented society. He looks at competition in the gym, sports field, financial and business arena, the political world to the social and sexual world and urges men to adapt to the outside forces. The key is in the expectations and how to recognize and plan for them. Candid and straightforward talk with vignettes drawn from Dr. Schwalbe's practice illustrate problems and solutions related to marriage, relationships, career, retirement (don't, he urges), divorce, death of a partner, fitness, nutrition, sexual behavior, dealing with adult children, lifestyle changes, financial planning, ageism, and many other topics. Schwalbe presents a heart-felt and therapeutically tested guide to keeping things in perspective in order to maintain self confidence and self esteem. Most importantly, this book is directed to the aging male baby boomer (and to those who love him, know him, or live with him). It tells him that he is not alone and that the intimate thoughts that he has about his aging body and mind are shared by millions of men who are in their 60s and are dealing with their new age.

First released in the Spring of 1999, How People Learn has been expanded to show how the theories and insights from the original book can translate into actions and practice, now making a real connection between classroom activities and learning behavior. This edition includes far-reaching suggestions for research that could increase the impact that classroom teaching has on actual learning. Like the original edition, this book offers exciting new research about the mind and the brain that provides answers to a number of compelling questions. When do infants begin to learn? How do experts learn and how is this different from non-experts? What can teachers and schools do-with curricula, classroom settings, and teaching methods--to help children learn most effectively? New evidence from many branches of science has significantly added to our understanding of what it means to know,

from the neural processes that occur during learning to the influence of culture on what people see and absorb. *How People Learn* examines these findings and their implications for what we teach, how we teach it, and how we assess what our children learn. The book uses exemplary teaching to illustrate how approaches based on what we now know result in in-depth learning. This new knowledge calls into question concepts and practices firmly entrenched in our current education system. Topics include: How learning actually changes the physical structure of the brain. How existing knowledge affects what people notice and how they learn. What the thought processes of experts tell us about how to teach. The amazing learning potential of infants. The relationship of classroom learning and everyday settings of community and workplace. Learning needs and opportunities for teachers. A realistic look at the role of technology in education.

Lack of learner motivation is the single greatest challenge before American schools and colleges. When students are self-motivated, they invest more and work harder at learning even if resources are inadequate. Jackson Kytle's provocative book argues that students and teachers waste time and energy because the conventional curriculum rests on flawed mental models. Hope for change requires a searching critique of modernity as well as expanded theories of human motivation and learning based on advances in neurobiology and cognitive studies.
