In mathematics, a function space is a set of functions between two fixed sets. Often, the domain and/or codomain will have additional structure which is inherited by the function space. For example, the set of functions from any set X into a vector space has a natural vector space structure given by pointwise addition and scalar multiplication. In other scenarios, the function space might inherit a topological or metric structure, hence the name function space.

In mathematics, a Fourier series ($f(t) = \sum_{r \in \mathbb{Z}} c_r e^{-i r t}$) is a periodic function composed of harmonically related sinusoids, combined by a weighted summation. With appropriate weights, one cycle (or period) of the summation can be made to approximate an arbitrary function in that interval (or the entire function if it too is periodic). As such, the summation is a synthesis of another function.

Functions are important mathematical objects. Usually they form infinite-dimensional function spaces, as noted already by Riemann [1]: $m \times p \times m$. and elaborated in the n th century by functional analysis. Taxonomy of spaces . Three taxonomic ranks . While each type of spaces has its own definition, the general idea of "space" evades formalization. Some
