Histopathological analysis. The histological analysis of the left first molars of the rats, which served as control, showed no alterations in the pulp or periapical tissues, and evidenced that 100% of these teeth presented healthy pulp and periapical tissues (Figures 1B, ,C). C). The teeth submitted to coronal opening in group 1, showed in 100% of the cases, necrosis in the coronal region and pulp inflammation with the presence of inflammatory cells and increased vascularization in the ...

Aims: Minor salivary gland tumours showing a predominant papillary-cystic structure are rare, and constitute a mixture of various types of neoplasm; thus, the histopathological assessment of these tumours poses a significant diagnostic challenge. We aimed to delineate the histological characteristics of these tumours and further mutational aspects with a particular focus on sialadenoma ...
