lighthouse powered by coal, whale oil, kerosene and other fuels became commonplace. One of the most novel lighthouse inventions, the Fresnel lens, came along in 1822 and used a network of prisms to magnify a small amount of light and cast a beam over distances of 20 miles (32.18 kilometers) or more.

How Lighthouses Work
| HowStuffWorks

Lighthouses generally work on the principle of reflecting a vertical light onto a horizontal surface. This horizontal surface is affixed with gigantic lenses called Fresnel lenses. The lens reflects the light in the form of a light beam.

Generally, the lens shifts

Though many ancient peoples built fires on hills and mountainsides to bring sailors home from the sea, the first great lighthouse was built on an island in the harbor of Alexandria, Egypt. The Pharos tower, built around 280 BC, was 450 feet high, and the light produced by a fire kept blazing on its roof ...
