This book focuses on innovative ways to create customized Word documents and templates. It contains an in-depth introduction to VBA (Visual Basic for Applications), which is the embedded programming language in the Microsoft Office 2007. VBA provides a complete integrated development environment (IDE) that allows for document automation, the process of using an automated template for creating documents. The book also includes coverage of the new features of Word 2007 including Content Controls, programming the Ribbon, and more.

Microsoft Word has grown considerably in power, sophistication and capability over the past decade, but one thing that hasn't changed since the early '90s is its user interface. The simple toolbar in version 2.0 has been packed with so many features since then that few users know where to find them all. Consequently, more and more people are looking for "insider" tips that will allow them to use these advanced and often hidden features. Microsoft has addressed this problem in Word 2007 by radically redesigning the user interface with a tabbed toolbar that makes every feature easy to locate and use. Unfortunately, Microsoft's documentation is as scant as ever, so even though you will be able to find advanced features, you might not know what to do with them. Word 2007: The Missing Manual, written specifically for this version of the software, explains basics like how to create documents, enter and edit text, format, print, and fax. You will will also learn how to create sophisticated page layouts, insert forms and tables, use graphics, and create book-length documents with outlines and Master Documents. Coverage also includes how to share documents with other people and programs, create web pages, automate documents with fields, and automate tasks with macros and the Visual Basic scripting language. This book shows you how to do it all.
