The second derivative of f(x), for x = 0, is given by f'(x) = 2 cos(2x) + 4 sin(2x) + 4 sin(2x). Thus: f'(x) = 2 cos(2x) + 4 sin(2x) + 4 sin(2x) = 2 cos(2x) + 8 sin(2x). Similarly f'(y) = 2 cos(2y) + 4 sin(2y) + 4 sin(2y) = 2 cos(2y) + 8 sin(2y). Hence, (x, y) is a sequence of nonsingular local minima, which evidently converges to x\*,

Nonlinear Programming: Theory and Algorithms—now in an extensively updated Third Edition—addresses the problem of optimizing an objective function in the presence of equality and inequality constraints. Many realistic problems cannot be adequately represented as a linear program owing to the nature of the nonlinearity of the objective function and/or the nonlinearity of any constraints.
