An OLED converts electric energy into light by using an organic material or a polymer as an active layer or emitter. The structure and the physical principle of OLEDs are shown in Fig. 19.16 . A basic diode

is composed of an emitter sandwiched between two electrodes: a transparent anode (usually ITO) and a metal cathode (usually of low work function, such as calcium or barium).

Organic Light-Emitting Diode - an overview | ScienceDirect ...

Obtaining white light from organic LEDs is a considerable challenge. Alongside the development of new materials with improved color stability and balanced charge transport properties, major issues involve the fabrication of large area devices and the development of low cost manufacturing technology.

Recent Advances in White Organic Light Emitting Materials ...

An organic light-emitting diode (OLED or organic LED), also known as organic electroluminescent (organic EL) diode, is a light-emitting diode (LED) in which the emissive electroluminescent layer is a film of organic compound that emits light in response to an electric current. This organic layer is situated between two electrodes; typically, at least one of these electrodes is transparent.
