Pseudomonas syringae is a rod-shaped, Gram-negative bacterium with polar flagella. As a plant pathogen, it can infect a wide range of species, and exists as over 50 different pathovars, all of which are available to researchers from international culture collections such as the NCPPB, ICMP, and others.. Pseudomonas syringae is a member of the genus Pseudomonas, and based on 16S rRNA analysis ...

Most researchers consider Pseudomonas syringae a weak pathogen, an opportunist that capitalizes on a host weakened by some predisposing condition. A number of factors reportedly make plants more susceptible to infection; foremost is freeze damage. Freezing wounds the plant, allowing the bacterium to get into and destroy plant cells.
