Two observational studies in cohorts of elderly subjects—the established populations for epidemiologic studies of the elderly and the Baltimore longitudinal study on aging—have shown that long term use of non-steroidal anti-inflammatory drugs is associated with improved cognitive function and a reduced risk of Alzheimer's disease. 1 2 A case-control study found that the regular use of aspirin or other non-steroidal antiinflammatory drugs such as ibuprofen, indomethacin, naproxen, and ...

Preventing functional decline and promoting functional independence for older adults are key goals for geriatric medicine. The increasing number of people in industrialised nations surviving into their 80s, 90s, and beyond is a tribute to the success of an increased standard of living, including better nutrition, sanitation, other public health measures, and the control of most infectious ...

Recent Advances in Geriatric Medicine The incidence of multiple chronic diseases affecting a single individual is common among elderly patients. This incidence is believed to be associated with a decline in many health outcomes, including quality of life, mobility, functional ability, increased frequency of hospitalizations, psychological distress, mortality and the use of health care resources.

~~Recent Advances in Geriatric Medicine~~

In a recent randomized trial involving nearly 400 PDRD patients and their caregivers, an integrated outpatient palliative care intervention administered by a neurologist, social worker, chaplain, and nurse, with selective involvement of a palliative medicine specialist, led to improved quality of life and global symptom burden, greater completion of advance directives, and lower caregiver burden by 12 months compared with standard care [13].

This book highlights recent advances in our understanding of sarcopenia and frailty in CKD. The prevalence of sarcopenia and frailty increases substantially as CKD progresses, and experimental studies have demonstrated the pivotal role of accumulated uremic toxin in the development of muscle wasting.

According to the National Institute of Aging there are more than half a billion people over the age of 65 across the globe. This has led to a need for medical and psychiatric care on a scale unprecedented in history. In light of this increase in the global elderly population, the field of geriatric medicine has expanded and become multidisciplinary to accommodate the need of the elderly in the 21st century. This volume highlights research in geriatric medicine across different disciplines. Chapters of this volume cover public health and economic consequences of aging in USA, cognitive impairment in old age, geriatric ophthalmology, osteoporosis, sleep disorders, speech-language pathology and geriatric care. Readers – both medical students and researchers - will find these topics useful for understanding issues in geriatric medicine and can use this information to improve geriatric programs in the healthcare sector.

This book, *Recent Advances in Geriatrics*, is based on the proceedings of the 8th Course of the School of Gerontology and Geriatrics held in Erice (Trapani, Italy) at the International Centre for Scientific Culture "Ettore Majorana" on March 20-25, 1997. This international effort was organized jointly by professors from the University of Palermo (Italy) and from Wayne State University (Michigan, USA) as a result of a cross-cultural collaboration of several years. The increasing average age of the populations in industrialized countries has resulted in increased interest in the different biological, medical, psychological, and economic aspects related to the health and social care of the elderly. Physicians and health care practitioners are realizing the need for a revised approach to geriatric care. Comprising contributions of clinicians and scientists from Italy and North America, the present volume provides a multidisciplinary approach to many gerontological and geriatric problems, examined from a scientific and a practical point of view. Several of the most important aspects of the aging process - the genetics of aging, body composition modification, immunological, endocrinological, and renal physiology changes - have been addressed. Data from a multi-center Italian study on centenarians is reported, together with an update on clinical and pharmacological approaches to dementia syndromes and economic and social aspects related to the care of the elderly.

The incidence of multiple chronic diseases affecting a single individual is common among elderly patients. This incidence is believed to be associated with a decline in many health outcomes, including quality of life, mobility, functional ability, increased frequency of hospitalizations, psychological distress, mortality and the use of health care resources. Health in elderly patients can fluctuate significantly, thus prompting the need for proper integration of comprehensive geriatric care. An increasing amount of data gained from research programs is making it clear that a geriatric assessment identifies many problems in older people with chronic diseases, adds prognostic information, and might improve the outcomes of these patients. This volume reviews research on the value of geriatric programs in different subspecialties of internal medicine. Chapters of this book cover different chronic diseases (coronary artery disease, kidney disease, diabetes, osteoporosis etc.) separately and present new findings in these areas. Readers – both medical students and researchers – will find the book an essential for understanding requirements and nuances of specialized geriatric programs in the healthcare sector.

This manual takes a multidisciplinary approach to neurological disorders in the elderly. Comprehensive and practical, it includes the most recent diagnostic criteria and immediately accessible visual care paths including the latest pharmacologic and non-pharmacologic interventions. Covering a range of modalities, from the importance and impact of each disease to diagnostic criteria, genetics, laboratory and imaging findings, treatment and care paths, this book focuses on neurological conditions that occur commonly in older persons or which have a striking effect on their lives. The common types of dementias, Parkinson's disease and related disorders, rapidly progressive diseases, seizure disorders and multiple sclerosis are covered. Issues commonly affecting this population, such as neurobehavioral symptoms and caregiver issues, are discussed. *Neuro-Geriatrics: A Clinical Manual* is aimed at any physician who treats the elderly with neurological disorders: neurologists, geriatricians and geriatric psychiatrists, both specialists and general practitioners.

This book offers an up-to-date review on the principles and practice of multidimensional assessment and management of the older individual, which represents the cornerstone of modern clinical practice in the elderly. The early chapters cover the main elements and scope of the comprehensive geriatric approach and explain the pathways of care from screening and case finding through to in-depth assessment and treatment planning. Subsequent chapters review the evidence of how best to apply the multidimensional assessment and management approach in defined healthcare settings and within specific clinical areas, such as cancer and surgery. Finally, the education and training challenges are reviewed and the prospects for future clinical service and research in this important field are examined. The book is very timely given the recent advances in application of this approach, which reflect the growing international realization that older people are "core business" in many clinical areas where the role of specialist geriatric medicine has hitherto been limited. Accordingly, the book will be relevant to a wide range of clinicians. The authorship comprises many of the best known and widely published experts in their respective fields.
