Lysergic acid diethylamide (LSD), also known colloquially as acid, is a hallucinogenic drug. Effects typically include altered thoughts, feelings, and awareness of one's surroundings. Many users see or hear things that do not exist. Dilated pupils, increased blood pressure, and increased body temperature are typical. Effects typically begin within half an hour and can last for up to 12 hours.

Lysergic acid diethylamide - Wikipedia

Prevalence and persistent use of psychotropic drugs in older adults receiving domiciliary care was high. Participants with dementia more often used antipsychotics and antidepressants than participants without dementia. The majority of the participants using antipsychotic drugs used traditional antipsychotics.

Prevalence and persistent use of psychotropic drugs in ...

Psychotropic medications are 'any drug capable of affecting the mind, emotions and behaviour'. The three main classes of psychotropics prescribed are antidepressants, anxiolytic/hypnotics (mostly benzodiazepines to manage anxiety and insomnia) and antipsychotics. Other psychotropic classes include anticonvulsants and stimulants. Because they affect the brain and mind, anti-dementia medication and opioids can be classed as psychotropic medication.

Psychotropic medications used in Australia - information ...

There are four main types of psychiatric medication: Antidepressants These are mostly prescribed for people experiencing depression, though you might also be offered an antidepressant if you're experiencing anxiety, obsessive-compulsive disorder (OCD), eating problems, or depression as part of another mental health problem.
