Despite the knowledge of prevention measures such as cessation of cigarette smoking the incidence continues to increase in many countries. The increase is particularly notable in females in the westernized countries where the death rate in females in certain regions surpasses that of breast cancer. Furthermore, in many developing countries lung cancer is now being diagnosed with increasing frequency in both sexes and it is expected to be a major cause of death in those countries later in this century or the beginning of next century if the tobacco consumption will continue its rapid rise.
